CC The present sequence represents a protein from Streptococcus pneumoniae.

CC The nucleic acid sequence encoding the Streptococcus pneumoniae protein

CC can be useful in vaccines for inducing protective antibodies against

CC Streptococcus pneumoniae, for treatment or prevention of infection e.g.

CC pneumonia, otitis media or meningitis. Probes based on the nucleic acid

CC are used to detect streptococcus infection (by usual hybridisation or

CC amplification methods), also for isolating Streptococcus genes or their

CC allelic variants. The protein can be used similarly to detect specific

CC antibodies in standard immunoassays, especially for diagnosing or

CC monitoring infections. Antibodies which bind the protein are used to

CC detect corresponding antigens, to purify the protein and for passive

CC immunisation (optionally coupled to a toxin). Vaccines are administered,

"" injection, orally or through the skin, typically at 0.01-1000

                    This is the amino acid sequence of a mouse SRY-related protein. The gen was isolated from a mouse genomic library using a CDNA fragment amplifie by primers T33009-10 as a probe. The screen isolated 4 EcoRI fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene. Sequence analysis reveale a 240 bp HMG box sequence between bases 7154-7393. Similarity with the human SRY HMG box sequence resulted in primers being generated to amplif the human SRY HMG box sequence for use as a probe to isolate the bovine SRY-related gene (T33008). The mouse and bovine genes are useful for determining the sex of an animal prior to birth.
                                                                                                                                                                                                                                                                                                                                                                                                                  JU-NOV-1994; JP-319525.

This is the amino acid sequence of the Streptococcus pneumoniae murb biosynthesis protein. The murb gene encodes the enzyme uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase. The nucleic acid can be used for the production of recombinant Murb protein and the implementation of large scale screens to identify new antibacterial compounds targeted at the stem peptide biosynthetic pathway involved in the synthesis of the bacterial cell wall. Structural analysis of the Murb protein will enable structure-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus pneumoniae mur D biosynthetic gene - which encodes uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligauseful for identifying antibacterial compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          drug design; resistance; Streptococcus pneumoniae. The present sequence represents Streptococcus pneumoniae MurD protein (uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase). (uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase). The MurD protein is useful in a method for identifying compounds that inhibit Streptococcus pneumoniae MurD activity. Compounds identified are potentially useful as antibacterial agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (ELIL) LILLY & CO ELI.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino identify likely H. pylori antigens for vaccine development, the amino

Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. py infection, and to detect Helicobacter Claim 61; Pages 1035-1036; 1481pp; English.

The present sequence is a Helicobacter pylori cytoplasmic prote involved in outer membrane or cell wall biosynthesis. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide bindin compounds, useful as potential H. pylori life cycle activators inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Berglindh

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; prevention; treatment; infection; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis; diagnosis; cytoplasmic; outer membrane; cell wall; biosynthesis.

                                                                                                                                            Potassium channel genes from Drosophila melanogaster and Caenorhabditis elegans - useful in assaying substances to determine effects on cell growth, and in inhibiting nematode and insect pests Claim 13; Page 49-53; 79pp; English.

This sequence is presented as a potassium channel sequence encoded by the CORK gene from Caenorhabditis elegans. An alternative sequence is given in R92315. The protein may be expressed in a heterologous host cell to assay substances to determine effects on cell growth. Potassium-agonists or potassium-antagonists identified by this method may be used as nematocides, anthelminthics or in therapy of cardiac
                                                                                                                                                                                                                                                                                                                                                                               CORK potassium channel protein alternative sequence.

potassium-antagonist; drug screening; nematocide; anthelminthic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                             Caenorhabditis elegans
                                                                                                                                                                                                                                                                                                                                                                         cardiac disorder

The amphiphilic peptide (SEQ ID NO 61) was prepd. by standard solid phase methods. The peptide is an analogue of the peptide chaving SEQ ID NO 3 (R2824), with an N-terminal extension of 8 amino acids. Substitution and deletion analogues of this peptide chaving SEQ ID NO 3 (R2826), with an are effective as pharmacceuticals e.g. antibiotics for bacterial, fungal or viral infections, or in spermicides or antitumour or antiparasitic agents. Additionally the peptides can be used in wound healing compsns. or for treating burns or other skin or eye infections. See also R22822-89.

Amino acid sequence of Shiva-5.
Shiva-5; lytic peptide; antimicrobial peptide; disease-resistant trichophyte; Shiva-2; Shiva-3; Shiva-4; Shiva-6; Shiva-7.
W08904371-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-AUG-1992 (first entry)
Amphiphilic peptide to inhibit growth of a target cell.
Antimicrobial; antifungal; antitumour; pharmaceuticals; antibiotics; antiparasitic; spermicides; burns; wound healing.
Synthetic.
Table I; 56pp; English.

agent, or polypeptide high in essential amino acids
Amino acid sequence of Shiva-5 as an exemplary lytic peptide for
use as an antimicrobial peptide contemplated for use in plant
                                                                  2-NOV-1988; U03908.

MPsrch\_ntp n.a. - n.a. Smith-Waterman search, using a protein database which has been backtranslated into n.a. using IUPAC symbols

Tabular output not generated. Run on: Wed Nov 24 01:07:37 1999; MasPar time 75.15 Seconds 1285.007 Million cell updates/sec

Description:
Perfect Score:
N.A. Sequence: Title: >US-09-103-287-1 (1-1351) from US09103287.seq 6755

1 ATGAGTAAGGAGTTTTATATA......TTAATATGTTTATAATAGAG 1351
TACTCATTCCTCAAAATATA......AATTATACAAATATTATCTC

Scoring table: TABLE bktranslate2 Gap 30

Comp:

Searched: 122461 seqs, 35738955 bases x 2 Nmatch

STD:

Dbase 0; Query 0

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

a-issued 1:5A\_COMB 2:5B\_COMB 3:PCT9\_COMB 4:backfiles1

Statistics: Mean 55.325; Variance 346.966; scale 0.159

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
